

GLAVES

stationary knives

Life of a stationary knife depends on its sharpness which in turn is obtained from its surface finish and accuracy of cutting angles. We have high precision machine tools which give perfect finish and accuracies.

We manufacture and sharpen the following types:

Tungsten Carbide Knives

Most widely used in high production palletizers. They last longer and can be reground for multiple usages. More expensive than stellite or through-hardened knives.

Ceramic Knives

Most expensive but widely used as life is very long. Generally lasts 2-3 times compared to tungsten carbide.

Stellited Knives

Cost effective solution with average life.

Through-Hardened Knives

Most economical solution but life is limited. Still being used on older models of palletizers for cost reason.

Advanced Materials

We also offer poly crystalline diamond (PCD) edged bed knives with excellent wear resistance for highly abrasive glass filled polymers.
