

## FEEL OF SILK ON YOUR TC BED KNIFE ???

Crazy idea? Well yes, and no! We do not mean to stick silk on your TC bed knife to make it smooth and silky. We make the surface smooth by a very special operation. Smoother the surface, lesser is the friction. There comes the importance of smooth silky surface on your TC blade. Well, we give a smoothness (or technically speaking roughness) value of Ra 0.05 Microns, and parallelity of faces within 2.5 microns, so as to give perfect gap adjustment. Flatness is within 2 light bands. And so when you close eyes and move finger on TC bed knife you find it ALL SILK!!! Isn't it amazing? Well not for us, because we at GLAVES ensure ONLY ONE THING, i m p r o v e m e n t, almost to the point of perfection.

So do not wait till the grooves are generated on your TC bed knife set; get them ground early to save your rotor. Better the set cleaner is the cutting. Best is to get rotor and bed knife pair ground as a set. This would automatically impart maximum life to both the rotor and bed knife pair and of course, result in cleaner cutting for longer periods.
